The PUR element (see AAQ44801) is located in a region of DNA bending activity which is a structural feature often associated with origins of DNA replication. The PUR procein ARR50310 binds to the PUR element. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                  Cloning and expression of PUR protein, involved in regulation of DNA replication - also oligo:nucleotide(s) and antibodies for use in the treatment of proliferative diseases, e.g. cancer.

```

PUR elements are purine-rich 24 nucleotide DNA sequences which occur at everaryotic origins of replication and 5' flanking regions of some cellular oncogenes. The PUR procesin (ARR50310) was originally identified as a 27kD HeLa cell nuclear factor that bound in a sequence-specific manner to a major site of DNA bending located 1.6kb upstream of the transcription start site of the human c-myc gene; the site recognised by PUR protein had the sequence AAQ44801. Gaps

```
This is the nucleotide sequence of the PUR element used in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections and hyperproliferative diseases such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of an oligonucleotide used in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins inhibitors of PUR activity may be useful for treating viral infections
                                                                                    PUR protein and its fragments - that inhibit PUR protein binding to PUR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein and its fragments - that inhibit PUR protein binding to PUR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PUR-alpha gene; inhibition; viral infection; cancer; PUR element; hyperproliferative disease; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                  The probes AAT99270-T99277 were used to screen for positive clones containing a 467 bp Sau3AI fragment of the human c-myc upstream region cloned into pUC19. Isolated sequences were then used as probes to screen an expression library for sequences encoding the PUR protein. The PUR sequence can be used to identify chemical or biological compounds that bind to PUR or binding fragments of PUR. Inhibitors of PUR activity may be used to treat hyperproliferative diseases such as cancer

The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. PUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR apen. The present sequence represents an oligonucleotide used in the identification and characterisation of the PUR protein and its sequence element PUR repeat, in an example from the
Oligonucleotide MR0700 used in PUR identification/characterisation.
                                                                                                                                                                                                                                                                                                                                                                                                                    Monoclonal antibody specific for PUR protein - useful for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a monoclonal antibody that specifically binds to an epicope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. FUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR gene. The present sequence represents an oligonuclectide used in the identification and characterisation of the PUR protein and its sequence element PUR repeat, in an example from the

The new invention relates to detecting open circomatin in genomic DNA by determining the hybridization of acapture probe to a treated sample compilification products and the untreated sample amplification products and the untreated sample amplification products or Specifically, the method comprises preparing a chromatin sample with an open chromatin DNA cleaving agent or produce the chromatin sample with an open chromatin DNA cleaving agent to produce fragments; performing a first amplification reaction using the fragments as a substrate, to produce treated-sample amplification products; concerning a second amplification reaction using the fragments as a substrate, to produce treated-sample amplification products and the chromatin DNA cleaving agent, to produce untreated-sample amplification products and the chromatin DNA cleaving agent, to produce untreated-sample amplification products with a capture probe; and cerraming the hybridization of the capture probe; and determining the hybridization of the capture probe; and where reduced hybridization of the capture probe to the products amplification products with a capture probe; and where reduced hybridization of the capture probe to the capture probe; and where reduced hybridization of the capture probe to the intreated-sample amplification products as compared to the hybridization of the capture probe to the untreated-sample amplification products as compared to the hybridization of the capture probe to the untreated sample amplification of the capture probe to the untreated sample amplification products as compared to the hybridization of creatment in genomic DNA. The methods and chromatin state profiling array, for detecting the response of cells and patients to candidate corresponse to a useful for detecting open chromatin in genomic DNA. The methods and are useful for monitoring treatment and evaluating the response of cells and patients to capture profiling array or restablished therapeutic agents. The present sequence is a 3' reverse primer for one-said
                                                                                                                                                                                                                                                                                                                                               genomic DNA by
                                                                                                                                                                       Detecting open chromatin comprises determining hybridization of the capture probe to the treated- and untreated-sample amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  65.0%; Score 15.6; DB 15; Length 25; 40.9%; Pred. This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered contains a heterologous functional domain that provides altered comprises a functionality in a nucleic acid cleavage assay. The enzyme comprises a 5, conclease, preferably a thermostable 5, nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a colymerase such that it exhibits reduced DNA synthetic activity from that cof the naturally occurring polymerase. Preferably the polymerase is a thermostable polymerase from a Thermus species such as T. aquaticus, T. Clarvage assay and an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved background specificity in the nucleic acid (a cytochrome cleavage structure comprises a RNA target nucleic acid (a cytochrome cleavage structure comprises a RNA target nucleic acid (a cytochrome comprises an non-target cleavage of the invasive cleavage structure comprises of fluorescence energy transfer or by detecting radioctivity luminescence, which is then detected by detecting radiocativity luminescence, which is then detected by colleavage product. The enzyme is useful for cleaving a nucleic acid which involves exposing a sample (a cell lysate) comprising substrate cleavage product. The enzyme is employed for detecting target DNAs and mutant alleles of genes including genes crown when any other animal or plants that are or may be used. If or her animal or plants that are or may be associated with for the enzyme is employed for may be associated with the colleavage product. The enzyme is employed for may be associated with for the enzyme is employed for may be associated which its colleavage browner and mutant alleles of genes including genes are associated when the partyme is the partyme and mutant a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease or other conditions. In addition, the enzymes may be useful for detecting and identifying strains of microorganisms including bacteria, fungi, protozoa, ciliates and viruses, preferably detecting and

This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered to contains a heterologous functional domain that provides altered to contains a heterologous functional domain that provides altered to an unclease, preferably a thermostable 5' nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a polymerase such that it exhibits reduced DNA synthetic activity from that of thermostable polymerase from a Thermus species such as T. aquaticus, T. flavus, T. thermophilus, T. filiformus or T. scotoductus. The enzyme comprises a hereologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved cleavage assay and an amino acid sequence that provides improved cleavage structure comprises a RNA target nucleic acid (a cytochrome P550, or cytokine RNA). Cleavage product, which is then detected by detecting radioactivity luminescence, phosphorescence, fluorescence of polarisation or charge. The enzyme is useful for cleavaing a uncleic acid to the enzyme which produces at least one detectable culcavage product. The enzyme is useful for cleavaing a uncleic acid to the enzyme which produces at least one detectable culcavage product. The enzyme is employed for detecting target DNAs and RNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with allesses or other conditions. In addition, the enzyme any beatspeciated with allesses or other conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detecting and identifying strains of microorganisms including bacteria, fungi, protozoa, ciliates and viruses, preferably detecting and identifying viruses having RNA genomes, such as hepatitis C and human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition comprising enzyme which comprises heterologous functional domain that provides altered functionality in nucleic acid cleavage assay, useful for cleaving nucleic acid, and detecting presence of RNA

This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered to contains a heterologous functional domain that provides altered functionality in a mucleic acid cleavage assay. The enzyme comprises a 5' nuclease, preferably a thermostable 5' nuclease, or a polymerase a 5' contains sequence related to a naturally occurring polymerase which is a contained polymerase from a Thermus species such as T. aquaticus, T. thermophilus, T. filiformus professes and a comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved cleavage structure comprises a RNA target nucleic acid (a cytochrome cleavage structure comprises as RNA target nucleic acid (a cytochrome cleavage structure comprises as RNA target nucleic acid (a cytochrome cleavage structure comprises or fluorescence annon-target cleavage product, which is then detected by detecting radioactivity luminescence, phosphorescence fluorescence code action or charge. The enzyme is useful for cleavage aubstrate code which involves exposing a sample (a cell lysate) cone detectable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleic acid to the enzyme which produces at least one detectable cleavage product. The enzyme is employed for detecting target DNAs and RNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with disease or other conditions. In addition, the enzymes may be useful for detecting and identifying strains of microorganisms including bacteria, fundi, protozoa, ciliates and viruses, preferably detecting and including and identifying viruses having RNA genomes, such as hepatitis C and human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 V, Ma W;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered functionality in a nucleic acid cleavage assay. The enzyme comprises a 5 nuclease, preferably a thermostable 5 nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a polymerase such that it exhibits reduced DNA synthetic activity from that of the naturally occurring polymerase. Preferably the polymerase is a thermostable polymerase from a Thermus species such as T. aquaticus, T. flavus, T. thermophilus, T. fillformus or T. scotoductus. The enzyme comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    background specificity in the nucleic acid cleavage assay. The invasive cleavage structure comprises a RNA target nucleic acid (a cytochrome P450, or cytoKine RNA). Cleavage of the invasive cleavage structure generates an non-target cleavage product, which is then detected by detecting fluorescence, mass or fluorescence energy transfer or by detecting radioactivity luminescence, phosphorescence, fluorescence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hall JG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates
which involves exposing a sample (a cell lysate) comprising substrate nucleic acid to the enzyme which produces at least one detectable cleavage product. The enzyme is employed for detecting target DNAs and RNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with disease or other conditions. In addition, the enzymes may be useful for detecting and identifying strains of microorganisms including bacteria, fungl, protozoa, ciliates and viruses, preferably detecting and identifying viruses having RNA genomes, such as hepatitis C and human
                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method has been developed for the identification of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bellon L;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      02-0CT-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic.
```

comprises: (a) introducing into the system a random library of nucleic acid catalyste (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalysic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of a least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and exalytic, activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and muttations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of suchity, AAV90922 to AAV93877 reperses tability against nuclease and activity. AAV90922 to AAV93877 repersesion of a Raf gene method, specifically for modulating the expression of a Raf gene

Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin. Claim 32; Page 80; 164pp; English.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha

Ouble-stranded CDNA was ligated to Eco RI adaptors
(Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pTT13 vector. Library went through one round of normalization. Tissue samples provided by Dr. Brian Dieckgraefe (Washington University, dieck@im.wustl.edu); colonic mucosa represents a range of disease involvement from moderate to severe Crohn's disease; samples include both perforating (fistulas) and non-perforating samples. Library constructed by Bento Soares and M. Fatima Bonaldo. "

/note="Vector: PWD42ny; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coll XII0-Gold (Stratagene) cells
and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwalp42 (gil #732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      24 bp mRNA linear EST 01-AUG-2003

/clone_lib="Mouse 10kb plasmid UUGCIM library"
/clone_wetor: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose get a 9.5 to
10.5 kb range using preparative agarose get of a 9.5 to
cf pWD42 (gil 4732114 gb | AF129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XII0-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucjectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XII0-GG14 (Stratagene) cells and selected for ampicillin resistance."

Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1) a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Laboratory Mouse DNR Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xili0-Gold (Stratagene) cells and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                               Issued_Patents_Nh:*

Sequence 15, Application US/08014943A

Patent No. 554551

GENERAL INFORMATION:

APPLICANT: Johnson, Edward M.

APPLICANT: Bargemann, Andrew D.

TITLE OF INVENTION: Cloning And Expression Of PUR Protein NUMBER OF SEQUENCES: 26

CORRESPONDENCE ADDRESS:

ADDRESSE: Pennie & Edmonds

STREET: 1155 Avenue of the Americas

CITY: New York

COMPUTER: New York

COMPUTER: New York

COMPUTER: Patentin Release #1.0, Version #1.25

COMPUTER: Patentin Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/014,943A

FILING DATE: 02)FEB11992

CLASSIFTCATION: 435

ATTORNEY/AGENT INFORMATION:

NAME: COTUZZI, LBUTA A.

RECISTRATION NUMBER: 6923-033

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1
